

Lunar and Planetary Science Conference, March 16th, 2014

COMMUNITY USER WORKSHOP
ON PLANETARY LIBS (CHEMCAM)
DATA

Additional LIBS Data Processing

Ryan Anderson (rbanderson@usgs.gov)
Agnes Cousin, Cecile Fabre, Olivier Gasnault,
Olivier Forni, Jeremie Lasue, Roger Wiens,
and the ChemCam Team

Univariate Calibration

- Use strength of a single emission line to predict compositions for that element
- Useful alternative to multivariate methods, especially for minor/trace elements
- Use calibration targets on the rover to build the model
 - Different laser energies require different models

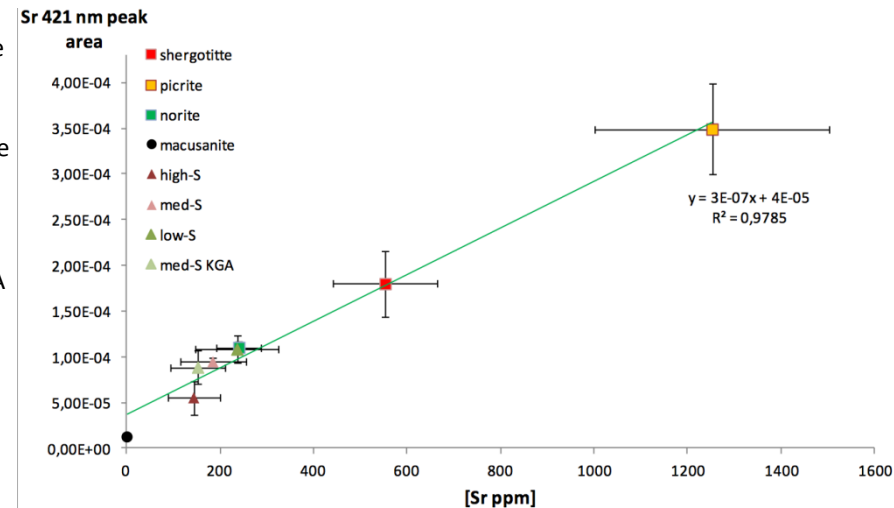

Univariate Calibration

Peak Fitting is Necessary:

- Use “cleaned calibrated spectra” (CCS)
- Peak fitting is necessary to isolate the emission line of interest, so that calculated peak area is accurate
- Calibration curves plot peak area vs known composition
- Taking ratios of lines can help correct for differences in intensity from different targets

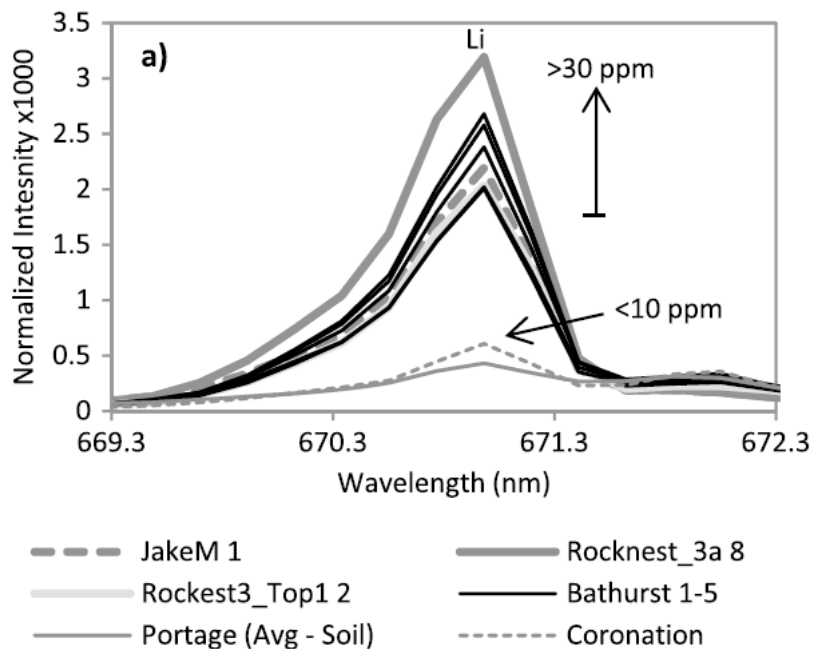

Example Calibration Curves:

Fabre et al., 2013

Trace Elements

- ChemCam can detect minor and trace elements, including: Li, Ba, Sr, Rb, Mn, F
- Univariate models and/or restricted-range PLS can be used to get approximate quantitative measurements
- Using the full wavelength range in PLS doesn't perform as well: strong lines dominate
- Also see presentations from Forni (CF detection - #1328), Lanza (Mn detection - #2599), and Ollila (Li, Ba, Sr, Rb - #2490) this week

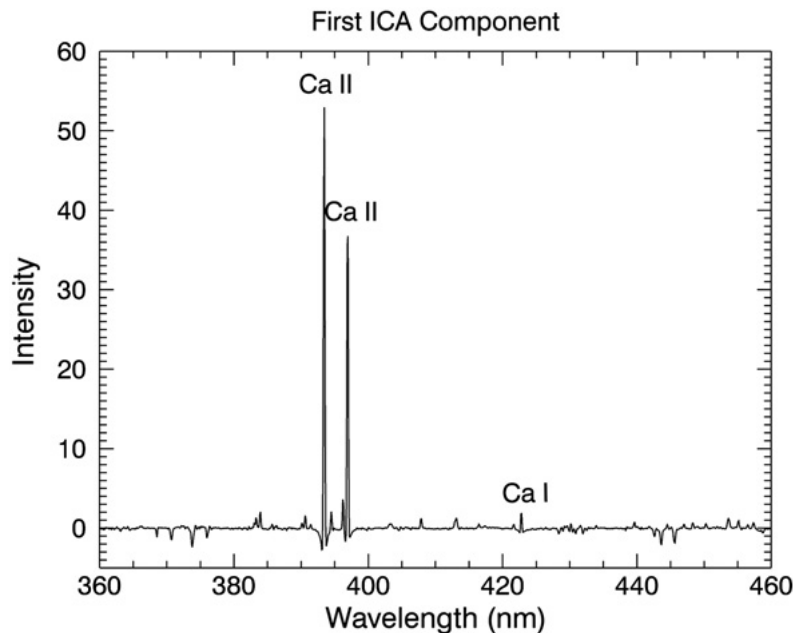

Ollila et al, 2013; this meeting

Forni et al. (this meeting)

Independent Component Analysis

- Similar to PCA, but seeks to minimize statistical dependence between components
 - Does not assume a Gaussian distribution as PCA does
 - Results in loadings that isolate individual elements → easier to read scores plots than PCA
 - Axes are a qualitative measure of signal from one element

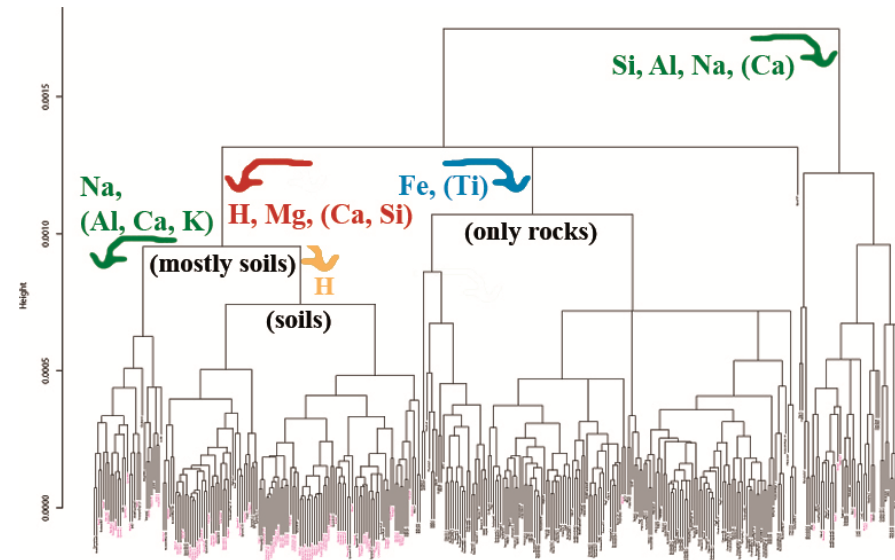

Anderson et al., 2014

Clustering / Classification

- Many different methods!
- Many use ICA or PCA scores as input

- Unsupervised:
 - Hierarchical clustering
 - K-means clustering
- Supervised:
 - SIMCA
 - PLS-DA

Anderson et al., 2013 LPSC

Gasnault et al., 2013 LPSC

Software Options

- Unscrambler
 - Pro: capable of most multivariate analysis methods, relatively user-friendly
 - Con: proprietary, expensive, not scriptable
- Programming languages:
 - IDL
 - **Primary language currently used by the CCAM team**
 - Pro: scriptable, has functions for some methods described
 - Con: expensive, learning curve, doesn't have functions for all methods
 - Python/Numpy/SciPy
 - Pro: free, scriptable, many libraries for multivariate analysis, widely used
 - Con: learning curve
 - R
 - Pro: very large library of statistical functions, free, widely used
 - Con: learning curve
- Many others!
- Questions? Ask a CCAM team member!
